

AIR FILTRATION

FILTER  
LAYR™

**FilterLayr redefines traditional filter media. FilterLayr is electrospun nanofibre which can be infused with active additives designed to trap and neutralise even the smallest airborne particles, while still allowing excellent airflow rates.**

FilterLayr filtration is able to trap microscopic airborne particles such as spores, allergens, bacteria and viruses.

FilterLayr can come in rolled goods for easy integration into a broad range of filtration applications like facemasks, cartridge masks, canister masks, and pleated HVAC filters.

Created using our proprietary 'Sonic Electrospinning Technology' method, it allows us to include functional additives to the chemistry of the nanofibre. It also guarantees the quality and high filter efficiency of the nanofibre.

## BENEFITS

Highly efficient PM2.5 protection — 99.99% of particles trapped.

Extremely lightweight, making it ideal for wearables.

Excellent filtration efficiency over a range of particle sizes due to the incredibly small pore sizes in the material and the electrostatic nature of the nanofibres.

High breathability because of the large pore volume.

Comparable pressure drops to meltblown fibres.

Options for added functionality (hypoallergenic, bactericidal and virucidal).

## FEATURES

- Made out of highly advanced electrospun nanofibre material.
- Incredibly high surface area — 1m<sup>2</sup> of FilterLayr contains 7.8m<sup>2</sup> of surface area and 8,300km of nanofibre.
- Wide-ranging functionality is available, including antibacterial and antiviral properties.
- Rolled goods ready to ship and shape.

## YOUR PRODUCT WITH FILTERLAYR

FilterLayr is used to improve the performance of wearable masks, respirators, pleated filters, canister filters and any other air filter.
